## 1 Definition

We define the **limit superior** of a sequence  $a_n$  as follows:

$$\limsup_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \left( \sup_{m \geq n} a_m \right)$$

An equivalent but perhaps more intuitive definition is:

$$\limsup_{n \rightarrow \infty} a_n = \sup S$$

Where  $S$  is the set of limits of all **convergent** subsequences of  $a_n$ . The **limit inferior** is defined similarly:

$$\liminf_{n \rightarrow \infty} a_n = \lim_{n \rightarrow \infty} \left( \inf_{m \geq n} a_m \right)$$

## 2 Interpretation

Consider some sequence  $a_n$  where the limit superior is not infinite. Then the limit superior  $b$  is the smallest real number s.t.  $\forall \epsilon > 0$ , there exist only a finite  $n$  s.t.  $a_n > b + \epsilon$ .

### 3 Examples

Define  $a_n = \sin n\pi$

### 4 Questions

Show that a sequence  $a_n$  converges iff:

$$\limsup_{n \rightarrow \infty} a_n = \liminf_{n \rightarrow \infty} a_n$$

Show that if the sequences  $a_n$  and  $b_n$  are bounded above then:

$$\limsup_{n \rightarrow \infty} (a_n + b_n) \leq \limsup_{n \rightarrow \infty} a_n + \limsup_{n \rightarrow \infty} b_n$$

and find a similar relation for the limit inferior.
