## 1 Definition

Formally we can define a sequence  $(a_n)_n$  as a mapping from the natural numbers to the reals or more generally the complex numbers. Informally a sequence is an ordered collection of numbers.

We make common use of the notation:

$$\underbrace{(a_n)_{n \in S}}_{\text{domain of the function}}$$

Denotes the sequence function

The domain of the function  $a_n$  is almost always the natural numbers which is abbreviated to just  $n$ , as above. It is also common to forgo the brackets and domain subscript and refer to the sequence simply as  $a_n$ .

## 2 Convergence

We say a sequence  $(a_n)_n$  **converges** to a limit  $L$  iff:

$$\forall \epsilon \in \mathbb{R} > 0 \exists N \in \mathbb{N} \text{ s.t. } \forall n \geq N, |a_n - L| < \epsilon$$

## 3 Algebra of Limits

Suppose  $(a_n)_n$  and  $(b_n)_n$  are convergent sequences with limit  $a$  and  $b$  respectively, then:

1.  $(|a_n|)_n$  converges with limit  $|a|$
2.  $(ka_n)_n$  converges with limit  $ka$
3.  $(a_n + b_n)_n$  converges with limit  $a + b$
4.  $(a_nb_n)_n$  converges with limit  $ab$
5. If  $b_n \neq 0 \forall n$  and  $b \neq 0$  then  $(\frac{a_n}{b_n})_n$  converges to  $\frac{a}{b}$
6. If  $b_n \neq 0 \forall n$  and  $b \neq 0$  then  $(\frac{1}{b_n})_n$  converges to  $\frac{1}{b}$

## 4 Sandwich Theorem

Suppose  $(a_n)_n$  and  $(b_n)_n$  are convergent sequences with the same limit  $L$ . The sandwich theorem states that:

$$\exists k \in \mathbb{N} \text{ s.t. } b_n \leq c_n \leq a_n \forall n \geq k \implies c_n \rightarrow L$$

## 5 Monotone Convergence Theorem

The **MCT** states that if a sequence  $a_n$  is bounded above and monotonically increasing ( $a_{n+1} \geq a_n \forall n$ ), then it is convergent. It can be shown that the limit is the supremum of the sequence.

### 5.1 Proof

Suppose  $a_n$  is monotone increasing and bounded with supremum  $L$ . Since  $L$  is the supremum:

$$\forall \epsilon > 0 \exists N \text{ s.t. } a_N > L - \epsilon$$

Now since the sequence is monotone increasing:

$$\forall \epsilon > 0 \exists N \text{ s.t. } \forall n \geq N, a_n > L - \epsilon$$

Rearranging the last part:

$$\forall \epsilon > 0 \exists N \text{ s.t. } \forall n \geq N, |a_n - L| < \epsilon$$

Which is the definition of convergence.
